

Claims

- 1 1. A method for making a catalytic converter comprising:
2 wrapping a catalytic converter core in an intumescent mat;
3 surrounding said catalytic converter core and said intumescent mat with a pre-
4 wound metal jacket;
5 compressing said pre-wound jacket around said catalytic converter core and
6 intumescent mat with tension bands; and
7 knocking said jacket at a frequency of 20 to 80 Hz during said compression to
8 cause setting of said intumescent mat between said core and said jacket.
- 1 2. A method as specified in claim 1, wherein said knocking is at a frequency of
2 40 to 50 Hz.
- 1 3. A method as specified in claim 1, wherein said knocking takes place for a
2 period exceeding 2 seconds.
- 1 4. A method as specified in claim 3, wherein said knocking takes place for a
2 period of about 4 to 5 seconds.
- 1 5. A method as specified in claim 1, wherein said intumescent mat has an overlap
2 and wherein said pre-wound metal jacket has an overlap, and wherein in said surrounding
3 said overlap of said jacket is offset from said overlap of said mat by approximately 180°.
- 1 6. A method as specified in claim 1, wherein said compression by said tension
2 bands is increased during said knocking.

1 7. A method as specified in claim 6, wherein said tension is increased to a value
2 of 10 to 30 kN.

1 8. A method as specified in claim 7, wherein said tension is increased to 20 kN.

1 9. A method as specified in claim 1, wherein said housing jacket is tacked by
2 spot welding after said compressing.

1 10. A method as specified in claim 9, wherein cores are welded to the ends of said
2 tack welded housing by circumferential seams, and wherein said housing jacket is welded
3 with a longitudinal seam following welding of said cones.

1 11. A catalytic converter made by the method of claim 1.

1 12. A catalytic converter made by the method of claim 5.

1 13. A catalytic converter made by the method of claim 10.
